

ABSTRACT OF THE DISCLOSURE

5 A blood testing tool is provided, which separates blood cells and can
collect blood plasma or blood serum with a high yield. The blood testing tool
includes an asymmetric porous membrane with a pore size distribution in
which an average pore size varies to be reduced continuously or
discontinuously in a thickness direction. The porous membrane includes a
blood supply portion, a development portion, and a blood-cell blocking
portion formed between the blood supply portion and the development
10 portion and pores in the blood cell blocking portion include only pores
through which blood cells cannot pass. When blood is supplied to one side
with larger pores of the blood supply portion, the blood moves in a direction
parallel to a surface of the porous membrane by a capillary phenomenon, but
only blood plasma or blood serum moves into the development portion to
15 develop.
